Figure 12: Pointwise posterior of component 6 (left) and the posterior of the cumulative sum of

Component 6: Uncorrelated noise with standard deviation increasing linearly away

This component models uncorrelated noise. The standard deviation of the noise increases linearly

This component explains 85.6% of the residual variance; this increases the total variance explained from 98.1% to 99.7%. The addition of this component reduces the cross validated MAE by 0.00% from 0.15 to 0.15. This component explains residual variance but does not improve MAE which suggests that this component describes very short term patterns, uncorrelated noise or is an artefact
